Adam Sieminski, Administrator
U.S. short term oil and natural gas outlook
Estimated U.S. shale gas production was 1.2 Bcm/d in September 2016 about 60% of total U.S. dry production (2.0 Bcm/d)

natural gas production (dry)
billion cubic meters per day

Shale gas production as a percent of total gas production

Sources: EIA Natural Gas Monthly, STEO through September 2016 and DrillingInfo.
Estimated U.S. tight oil production was 3.9 MMbbl/d in September 2016 about 47% of total U.S. oil production (8.4 MMbbl/d)

Sources: EIA derived from state administrative data collected by DrillingInfo Inc. Data are through September 2016 and represent EIA’s official tight oil estimates, but are not survey data. State abbreviations indicate primary state(s).
EIA forecasts Henry Hub spot prices to average $3.15/MMBtu and West Texas intermediate crude oil to average $47/b this winter.

Note: Confidence interval derived from options market information for the 5 trading days ending October 6, 2016. Intervals not calculated for months with sparse trading in near-the-money options contracts. Source: EIA Short-Term Energy Outlook, October 2016, and CME Group.
Both natural gas and renewable generation surpass coal by 2030 in the Reference case, but only natural gas does so in the No CPP case.

International long-term energy outlook
Key findings in EIA’s long-term global outlook (IEO2016)

- World energy consumption increases from 549 quadrillion Btu in 2012 to 629 quadrillion Btu in 2020 and then to 815 quadrillion Btu in 2040, a 48% increase (1.4%/year). Non-OECD Asia (including China and India) account for more than half of the increase. Population grows 0.9%/year.

- The industrial sector continues to account for the largest share of delivered energy consumption; the world industrial sector still consumes over half of global delivered energy in 2040.

- Renewable energy is the world’s fastest-growing energy source, increasing by 2.6%/year; nuclear energy grows by 2.3%/year, from 4% of the global total in 2012 to 6% in 2040.

- Fossil fuels continue to supply more than three-fourths of world energy use in 2040.
Key findings in the IEO2016 (continued)

• Among the fossil fuels, natural gas grows the fastest. Coal use plateaus in the mid-term as China shifts from energy-intensive industries to services and worldwide policies to limit coal use intensify. By 2030, natural gas surpasses coal as the world’s second largest energy source.

• In 2012, coal provided 40% of the world’s total net electricity generation. By 2040, coal, natural gas, and renewable energy sources provide roughly equal shares (28-29%) of world generation.

• With current policies and regulations, worldwide energy-related carbon dioxide emissions rise from about 32 billion metric tons in 2012 to 36 billion metric tons in 2020 and then to 43 billion metric tons in 2040, a 34% increase.
Economic activity and population drive increases in energy use; energy intensity (E/GDP) improvements moderate this trend

average annual percent change (2012–40)
percent per year

Global energy shares: renewables grow fastest, coal use plateaus, natural gas surpasses coal by 2030, and oil maintains its leading share

As total world energy consumption grows, shares by end-use sector remain relatively unchanged

world delivered energy consumption by end-use sector
quadillion Btu

Liquid fuels markets
Near-term crude oil price scenario is lower in AEO2016

Brent crude oil spot price
2015 dollars per barrel

Passenger-miles per person will rise as GDP per capita grows; travel growth is largely outside the OECD

passenger-miles per capita (left-axis) and GDP per capita (horizontal-axis) for selected country groupings 2010–40

Natural gas markets
Shale gas, tight gas, and coalbed methane will become increasingly important to gas supplies, not only for the U.S., but also China and Canada.

Natural gas production by type
trillion cubic meters

Note: Other natural gas includes natural gas produced from structural and stratigraphic traps (e.g. reservoirs), historically referred to as ‘conventional’ production.

Liquefaction capacity additions over the 2015-19 time period will increase global capacity by over 30%

LNG capacity additions
million cubic meters per day

Note: Capacity additions in 2015-19 include projects currently under construction, and represent nameplate capacity, not adjusted for ramp-up.

Source: U.S. Energy Information Administration estimates based on trade press.
Electricity markets
Of the world’s three largest coal consumers, only India is projected to continue to increase throughout the projection.

Coal consumption in the US, China, and India.

History Projections

History

Projections

Renewables, natural gas, and coal all contribute roughly the same amount of global net electricity generation in 2040.

World net electricity generation by source (trillion kilowatt-hours)
